Homework 5 - STAT 511

Amal Agarwal

Answer 5

- > # extracting the cars dataset
- > data(cars)
- > # response (speed) and predictor (distance) vectors
- > speed<-cars\$speed
- > distance<-cars\$dist
- > # fitting the simple linear model
- > fit=lm(distance~speed)
- > # scatter plot with fitted line
- > plot(speed,distance)
- > abline(fit)

(a) $\hat{\beta}$ is given as

```
> # creating vector of 1's for intercept
```

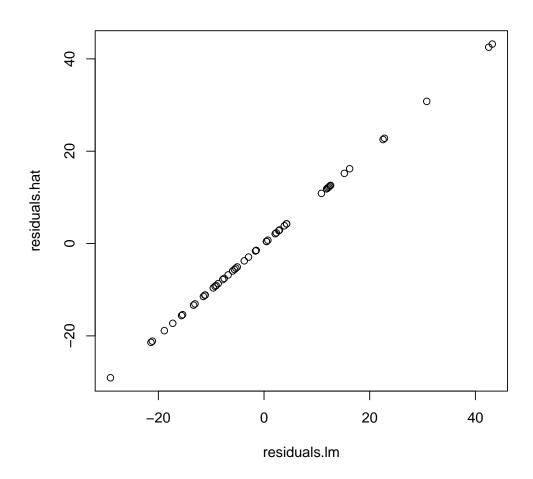

- > x1<-rep(1,length(speed))</pre>
- > # creating design matrix
- > X=matrix(0,nrow=length(speed), ncol=2)
- > X[,1]<-x1
- > X[,2]<-speed
- > # calculating estimated parameters using design matrix and Y (distance).
- > beta.hat<-(solve(t(X)%*%X))%*%(t(X))%*%distance
- > beta.hat

[,1]

[1,] -17.579095

[2,] 3.932409

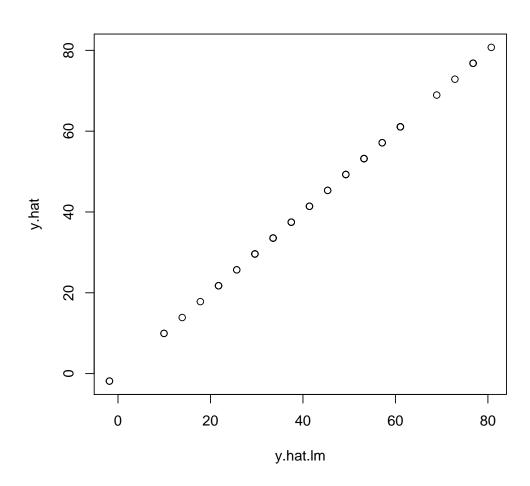

- (b) The residuals are calculated as
- > # calculating residuals using matrix operations
- > residuals.hat<-distance-(X%*%beta.hat)</pre>
- > # residuals from lm
- > residuals.lm<-fit\$resid
- > # plotting residuals.hat vs. residuals.lm
- > plot(residuals.lm,residuals.hat)

- (c) $\hat{\sigma}^2$ is calculated as
 - > # calculating estimated variance
 - > n<-length(distance)
 - > p<-2
 - > var.hat<-(1/(n-p))*(t(residuals.hat)%*%(residuals.hat))</pre>
 - > var.hat

(d) \hat{y} are calculated as

- > # calculating Hat Matrix
- > Hat.mat < -X%*%(solve(t(X)%*%X))%*%(t(X))
- > # calculated estimated response
- > y.hat<-Hat.mat%*%distance
- > # estimated response from lm
- > y.hat.lm<-fit\$fitted.values
- > # plotting y.hat vs. y.hat.lm
- > plot(y.hat.lm,y.hat)

```
> # calculating variance of estimated parameters
                 > sqrt.beta.var.hat<-rep(0,2)
                  > L < -(solve(t(X)\%*\%X))
                  > for (i in 1:2){
                                   sqrt.beta.var.hat[i] <-sqrt(var.hat*L[i,i])</pre>
                  + }
                  > sqrt.beta.var.hat
                  [1] 6.7584402 0.4155128
(f) The p-values are calculated as:
                 > # calculating p-values
                 > p.values<-rep(0,2)</pre>
                  > for (i in 1:2){
                                  p.values[i] <-2*pt((-abs(beta.hat[i])/sqrt.beta.var.hat[i]), df=n-p)</pre>
                  + }
                  > p.values
                  [1] 1.231882e-02 1.489836e-12
(g) The coefficient of determination can be calculated as:
                  > R.sq<-(t(y.hat-mean(y.hat))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(y.hat)))/(t(distance-mean(distance))%*%(y.hat-mean(distance))%(y.hat-mean(distance))/(t(distance))%(y.hat-mean(distance))/(t(distance))/(t(distance))%(y.hat-mean(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(distance))/(t(dista
                  > R.sq
                                                               [,1]
                  [1,] 0.6510794
```

(e) se_k for the parameters are calculated as
